Familiarize yourself with phishing attacks
HR and Marketing Team

Nurlyza Lubis

What is phishing?

Phishing is an act of cyberattack where an attacker tricks someone into giving away sensitive information (like passwords, bank details, or personal data) by pretending to be a trusted source.

It usually happens through emails, text messages, fake websites, and phone calls.

The message is designed to look like they came from a legitimate company.

The goal is to get you to click a malicious link, open an attachment, or enter your credentials into a fake login page.

Learn to spot phishing emails

- Suspicious emails
- Look at the greeting
- Urgent or threatening emails
- Suspicious links or attachments
- Spelling & grammar mistakes
- Requests for sensitive info
- Too good to be true

How do we stop getting phished?

- Be skeptical of unexpected message
- Double check links and senders
- Use strong unique passwords
- Turn on MFA
- Educate yourself and others
